# Guess with your neighbors!

## k-Nearest Neighbors

#### **Prompts**

- Create a new column "yammy", where "star\_rating" >= 4.5, it's a 1, otherwise 0.
- Count Os and 1s in the "yammy" column

- Scale the data
- Build a kNN classifier with "yammy" as the target

## Strategy

- Create a Teacher
- Check the Balance
- Scale the Features
- Train the kNN Model
- Check the Accuracy Read the Confusion Matrix
- Split the Data

#### Code & Results

#### 1. Create a Teacher

This code checks the "star\_rating" and puts a 1 in the new "yammy" column if it is greater than or equal to 4.5.

```
import pandas as pd
# Assuming you already have a DataFrame named df
data['yammy'] = (data['star_rating'] >= 4.5).astype(int)
data.head()
```

#### Thus, we have the "Yammy" column.

#### 2. Check the Balance

This code counts the number of Os and 1s in the "Yammy" column.

```
data['yammy'].value_counts().sort_index()
         We have 64 "meh" tins and 57 "yummy" ones.
    64
    57
```

#### 3. Scale the Features

This code puts features between 0 and 1.

```
from sklearn.preprocessing import MinMaxScaler
# Select only numeric columns (excluding 'yammy' if it's a label)
features = data.drop(columns=['yammy']) # Drop target column if needed
numeric_cols = features.select_dtypes(include=['float64', 'int64']).columns
scaler = MinMaxScaler()
data[numeric_cols] = scaler.fit_transform(data[numeric_cols])
data[numeric_cols].head()
                                                                                     company_me- company_meat company_purepet comp
            weight star_rating total_comments adult chicken wet from_ocean company_farmina
```

<b>0</b> 0.022888 0.113797 0.60 0.638163 1.0 0.0 1.0 1.0 0.0 0.0		
	0.0	1.0
<b>1</b> 0.128879 0.697885 0.65 0.904091 1.0 0.0 1.0 1.0 0.0 0.0	0.0	1.0
<b>2</b> 0.285714 0.697885 0.75 0.620522 1.0 0.0 1.0 1.0 0.0 0.0	0.0	0.0
<b>3</b> 0.059754 0.234642 0.50 0.348278 1.0 0.0 1.0 1.0 0.0 0.0	1.0	0.0
<b>4</b> 0.050538 0.103726 0.75 1.000000 0.5 0.0 1.0 1.0 0.0 0.0	0.0	0.0

### 4. Split the Data

This code first splits the teacher from the features and then splits the data into training and testing sets.

```
from sklearn.model_selection import train_test_split
# Separate features and target
X = data.drop(columns=['yammy','star_rating'])
y = data['yammy']
# Split into training and test sets
X_train, X_test, y_train, y_test = train_test_split(X, y, test_size=0.2, random_state=42)
```

## 5. Train the Model

This code creates a logistic regression model and trains it using the training set.

```
From sklearn.neighbors import KNeighborsClassifier
# Initialize the model (default k=5)
knn = KNeighborsClassifier(n_neighbors=5)
knn.fit(X_train, y_train)
```

#### 6. Check the Accuracy & Confusion Matrix

This code evaluates model accuracy and calculates a confusion matrix.

```
y_pred = knn.predict(X_test)
print("Accuracy:", accuracy_score(y_test, y_pred))
print("Confusion Matrix:\n", confusion_matrix(y_test, y_pred))
print("Classification Report:\n", classification_report(y_test, y_pred))
```

Accuracy: 0.8 Confusion Matrix: [[12 3] [ 2 8]]

✓ The model got 80% of the tins right.

X It made some mistakes:

- It mislabeled 3 out of 15 meh tins as yammy
- It mislabeled 2 out of 10 yammy tins as meh

So it's doing well overall, but still has room to learn!
